SUBUNIT: Binds to the cytoplasmic domain of cell surface receptors, such as CD2, CD4, CD5, CD8, CD44, CD45 and CD122. Also binds to effector molecules, such as P14K, VAV1, RASA1, FYB and to other proteins kinases including CDC2, RAF1, ZAP70 and SYK. Binds to phosphatidylinositol 3'-kinase (PI3K) from T lymphocytes through its SH3 domain and to the tyrosine phosphorylated form of KHDRBS1/p70 through its SH2 domain. Interacts with SQSTM1.

Interacts with phosphorylated LIME1. Interacts with CBLB (By

-!- FUNCTION: Tyrosine kinase that plays an essential role for the selection and maturation of developing T-cell in the thymus and in mature T-cell function. Is constitutively associated with the cytoplasmic portions of the CD4 and CD8 surface receptors and plays a key role in T-cell antigen receptor(TCR)-linked signal transduction pathways. Association of the TCR with a peptide antigen-bound MHC complex facilitates the interaction of CD4 and CD8 with MHC class II and class I molecules, respectively, and thereby recruits the associated LCK to the vicinity of the TCR/CD3
                                                                                                                                                                                                                           the

tyrosine phosphate.

1. ENZYME REGULATION: Regulated by phosphatases.

2. -1- ENZYME REGULATION: Regulated by phosphatases.

3. SUBJUNIT: Binds to the cytoplasmic domain of cell surface receptors, such as CD2, CD4, CD5, CD8, CD4, CD5 and CD12. Also binds to effector molecules, such as F14K, VAV1, RASA1, FYB and to other proteins kinases including CDC2, RAF1, ZAP70 and SYK. Binds to phosphatidylinositol 3' Kinase (P13K) from T lymphocytes through its SH3 domain and to the tyrosine phosphorylated form of KHDRES1/p70 through its SH2 domain. Interacts with CBLB (By similarity). Interacts with Saminine herpesvirus 2 TIP.

2. SUBCELLULAR LOCATION: Cytoplasmic and attached to the membrane.

3. Present in lipid rafts in an unactive form (By similarity).

3. SUBJUNITELINIAR LOCATION: Cytoplasmic form (By similarity).

3. SUBJUNITELINIAR SECTICITY: Expressed specifically in lymphoid cells.

4. DEVELOPMENTAL STAGES: Levels remain relatively constant throughout
              immunoreceptor tyrosines besed activation motifs (ITAMs) in the cytoplasmic tails of the TCRgamma chains and CD3 subunits, initiating the TCRCP1 signaling pathway. In addition, contributes to signaling by other receptor molecules. Associates directly with the cytoplasmic tail of CD2, and upon engagement of the CD2 molecule, LCK undergoes hyperphosphorylation and activation. Also plays a role in the IL2 receptor-linked signaling pathway that controls T-cell proliferative response. Binding of IL2 to its receptor results in increased activity of LCK. Is expressed at all stages of thymocyte development and is required for the regulation of maturation events that are governed by both pre-TCR and mature alpha beta TCR (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Copyrighted by the UniProt Consortium, see http://www.uniprot.org/terms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              phosphorylation downregulates catalytic activity. Phosphorylated on Tyr-393 either by itself or another kinase, leading to increased enzymatic activity.

-!- SIMILARITY: Belongs to the Tyr protein kinase family.
-!- SIMILARITY: Contains 1 SH2 domain.
-!- SIMILARITY: Contains 1 SH3 domain.
-!- GAUTION: LCK seems to be active in all vertebrates, except in squirrel monkey T-cells, in which it is inactivated. The reason seems to be that squirrel monkey are the natural host for Saimirine herpesvirus 2, which is able to efficiently transform T-cells through a mecanism involving viral Tip/ host LCK.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Distributed under the Creative Commons Attribution-NoDerivs License

LA CARLACTE C., Mullina J. I., Bruck C., Ruebsamen-Waigmann H.;

T. Additional member of the protein-tyrosine kinase family: the src- and recent protein Course.

I. CARLACTION Tyrosine kinase that plays an essential role for the selection and maturation of developing T-cell in the thymus and in mature T-cell function. Is constitutively associated with the cytoplasmic portions of the CD4 and CD8 surface receptors and plays a key role in T-cell antigen receptor (TCR)-linked signal transduction pathways (By similarity).

C. CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + a protein tyrosine phosphate.

C. CATALYTIC Binds to the cytoplasmic domain of cell surface receptors, such as CD4, CD8 (By similarity).

C. SUBGELLULAR LOCATION: Bound to the cytoplasmic domain of either receptors.

C. SUBCELLULAR LOCATION: Bound to the cytoplasmic domain of mature in the cytoplasmic domain of mature in the cytoplasmic domain of either receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Copyrighted by the UniProt Consortium, see http://www.uniprot.org/terms Distributed under the Creative Commons Attribution-NoDerivs License

Chow L., Ratcliffe M., Veillette A.;
"tkl is the avian homolog of the mammalian lck tyrosine protein kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -!- PTM: Phosphorylated on Tyr-503. This phosphorylation downregulates catalytic activity. Phosphorylated on Tyr-392 either by itself or another kinase, leading to increased enzymatic activity.
-!- SIMILARITY: Belongs to the Tyr protein kinase family. SRC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Proto-oncogene tyrosine-protein kinase LCK.

DNA Res. 9:189-197 (2002).
-!- SUBCELLULAR LOCATION: Inner membrane-associated (By similarity).
-!- SIMILARITY: Belongs to the ABC transporter family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDLINE=22484998; PubMed=12597275; DOI=10.1093/dnares/9.6.189; Kaneko T., Nakamura Y., Sato S., Minamisawa K., Uchiumi T., Sasamoto S., Watanabe A., Idesawa K., Iriguchi M., Kawashima K., Kohara M., Matsumoto M., Shimpo S., Tsuruoka H., Wada T., Yamada M.,

The invention relates to a method for the detection of antigen specific recells in a blood sample involving the use of a plurality of antigenic peptides. The method comprises sampling of peripheral blood monocytes; stimulation of the collected peripheral blood monocytes with antigens without direct use of antigen presenting cells; and detection of T-cells specific to the antigen in the stimulated monocytes. The method is particularly used for the detection of cancer specific tan be used in semi-quantitative determination of cancer specific T-cells. It can also be used for cancer vaccine therapy for patients with cervical or prostate cancer. The method can additionally be used to monitor of cellular immunity and cancer immune therapy by detection of specific T-cell frequencies. Sequences ABR84165 represent HLA-A2 (human leukocyte antigen) peptides of human origin used in an example from the
                                                                                                                                                                                                                     A detection method of antigen specific T-cells, comprises the use of plural antigenic peptides, useful in semi-quantitative determination of cancer specific T-cell frequencies and for monitoring cellular immunity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    vaccine; ubiquitin; Ub; T-cell target; melanoma; sarcoma; Hodgkins lymphoma; non-Hodgkins; leukaemia; neuroblastcoma; myeloma; lung cancer; stomach; skin; thyroid; ovary; prostate; womb; pancreas; colon; bladder; breast; oesophagus; kidney; brain; human; epitope; Lck.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tumor antigen peptides which induce tumor-specific cytotoxic T-cells and polynucleotides encoding them for treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to peptides which are partial sequences of stor/lok family proteins. The present sequence is one such peptide. The peptides are useful for producing vaccines for the treatment of cancer, including colon cancer and small-cell lung cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antigen specific T-cell; detection; diagnosis; cancer specific T-cell; cancer; tumour; cervical cancer; prostate cancer; cellular immunity; immune therapy; cytostatic; immunostimulant; vaccine; antigenic peptide; human; human leukcyte antigen; HLA-A2 epitope.
                                                                                                                                                                                                                                                                                                   Src protein; lck protein; vaccine; colon cancer; small-cell lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 41; DB 4; Length 9; 100.0%; Pred.                                                                                                                                                             à
                                                                                                                                                                                                                                                                                                                                                                                                                                                          0
                                                                                                                                                                    The invention relates to a novel genetic vaccine containing the ubiquitin gene together with a gene encoding an antigenic protein containing a T-cell target sequence. The vaccine of the invention may be useful for prevention and treatment cencers including melanoma, sarcoma, lymphoma (Hodgkins or non-Hodgkins), leukaemia, neuroblastoma, myeloma and cancer of the lung, stomach, skin, thyroid, ovary, prostate, womb, pancreas, colon, bladder, breast, oesophagus, kidney or brain. The current sequence is that of a human genetic vaccine/ubiquitin (Ub)-related epitope peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of treating a cancer patient by administering cancer antigens to patient, involves evaluating presence or absence of specific cytotoxic T-lymphocyte precursors for individual peptides contained in set of cancer antigen peptides, in patient, removing peptide being non-specific to precursors, from cancer antigen peptide set to prepare set for administration, and administering cancer antigen peptide set to patient. The method is useful for treating cancer patient by administering cancer natigens to patient. The present sequence

The invention provides a novel method of altering the activity of the protein kinase A (PKA) signaling pathway in a cell that comprises altering the extent of phosphorylation of one or more PKA aubstrates, or kinase substrates downstream in the PKA signaling pathway. Pharmaceutical compositions containing a nucleic acid molecule that encodes a PKA substrate, or fragment, precurers or functionally equivalent variant, where the sequence is modified to alter its susceptibility to phosphorylation by PKA can be used for treating a disorder exhibiting abnormal PKA signaling activity, immunosuppressive disorders or proliferative diseases. They can be used for treating e.g. HIV infection, ALDS, common variable immunodeficiency or cancers. Conditions in which upregulation of the PKA pathway is required, such as autoimmune disease, e.g. systemic lupus erythematosus, may also be treated. The present sequence represents a PKA substrate, wherein the substrate is in the Srcfamily, preferrably Lck, Fyn, Src, Yes, Fgr, Lyn, Hck Blk, Yrk, c-tkl,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method of identifying a candidate p21 or p53 pathway modulating agent. This comprises providing an assay system comprising a modulator of p21 or p53 (MP2153) polypeptide or nucleic acid, contacting the assay system with a test agent, where in its presence the system provides a reference activity, and detecting a test agent-biased activity of the assay system, wherein a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate p21 or p53 pathway modulating agent. The methods and compositions of the present invention are useful for the dispansis and/or treatment of diseases or conditions associated with aberrant expression or activity of the p21 or p53 pathway, such as cancer, preferably colon or head and neck cancer. The present sequence is a human MP2153 protein sequence of the invention.

The compound is an antisense oligcnucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human Lck polypeptide and in preparation of a composition for treating human Lck polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotide compounds, useful for diagnosing, preventing and/or treating diseases or conditions associated with aberrant expression or activity of Lck, such as hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                 Human lymphocyte specific tyrosine kinase (Lck) polypeptide #1

Sequences AAY43902-Y44015 represent proteins used in a novel method of predicting the folded structure of proteins, by aligning sequences of homologous proteins and using patterns of evolutionarily conserved and varied sequences to assign positions. Positions in the alignment are assigned to the surface or inside of the folded structure, active sites, and parsing segments. Secondary structural units are assigned by identifying periodicity in the assignments, and assembled into globular form using distance constraints imposed by disulfide bridges, active site assignments and co-variation analysis. The predicted secondary structures are useful for identifying antigenic sites on a protein molecule, as interaction of a protein with other molecules
                                                                                   Predicting the folded structure of proteins.

                                                                                                                                                                                                                                                                                                                                                                                      Sequences AAY43902-Y44015 represent proteins used in a novel method of predicting the folded structure of proteins, by aligning sequences of homologous proteins and using patterns of evolutionarily conserved and varied sequences to assign positions. Positions in the alignment are assigned to the surface or inside of the folded structure, active sites, and parsing segments. Secondary structural units are assigned by identifying periodicity in the assignments, and assembled into globular form using distance constraints imposed by disulfide bridges, active site assignments and co-variation analysis. The predicted secondary structures are useful for identifying antigenic sites on a protein molecule, as quides for site directed mutagenesis studies, and for understanding the interaction of a protein with other molecules
Prediction; secondary structure, alignment; evolutionary conservation; homology; periodicity; co-variation analysis; antigenic site; site directed mutagenesis; interaction.

This position is 364 in the full-length sequence (see ABR56202 for the wild-type full length sequence"
The present invention relates to a method of designing a ligand binding scaffolds compounds binding to members of a molecular family, detecting or instance compounds binding to members of a molecular family, detecting orientation of scaffolds at binding site of target, and synthesising ligand. The invention is useful for designing drug products and for designing ligand binding to target molecules such as nuclear hormone receptors, TNF receptors, G-protein coupled receptors, methyl transferases, ligases, etc. The present sequence is the LCK tyrosine kinase protein. This sequence is used to illustrate the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; protein co-ordinate data; Lymphocyte Cell Kinase; Lck; enzyme

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
```

The present invention relates to a crystalline polypeptide (I), comprising the catalytic domain of human Lymphocyte Cell Kinsse (Lck) protein. Lck is a Src-family protein tyrosine kinsse expressed primarily in T-cells and plays an essential roll in immune response. (I) is useful for identifying a compound which is an inhibitor of human Lck protein.

                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "Wild-type D substituted with N. This position is 364 in the full-length sequence (see ABR56202 for the wild-type full length sequence"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a crystalline polypeptide (I), comprising the caralytic domain of human Lymphocyte Cell Kinase (Lck) procein. Lck is a Sro-family protein tyrosine kinase expressed primarily in T-cells and plays an essential role in immune response. (I) is useful for identifying a compound which is an inhibitor of human Lck protein. The present sequence is a mutated fragment of the human Lck sequence, which approximately comprises the catalytic domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ā

modulates T lymphocyte activation. The method comprises contacting a T cell comprising an A-raf-1 or TCPPP/PTPNZ polypeptide with a compound, where the A-raf-1 or TCPPP/PTPNZ polypeptide with a compound, the A-raf-1 or TCPPP/PTPNZ polypeptide is encoded by a nucleic acid that hybridises to a nucleic acid encoding a polypeptide having a sequence selected from two 606-amino acid sequence and a 415-amino acid sequence given in the specification. The method of the invention has immunosuppressive, antiasthmatic, antiallargic, and antiinflammatory activity. The method is useful for identifying compounds that modulate lymphocyte activation and migration, and for monitoring changes in cell surface marker expression, cytckine production, antibody production, proliferation and differentiation, and apoptosis, using either cell lines or primary cells. The A-raf-1 or TCPTP/PTPNZ proteins may be used as drug tragets for compounds that suppress or activate lymphocyte activation and migration, e.g. for the treatment of diseases in which modulation of the immune response is desired such as delayed type activation and acute and chronic inflammation. Modulators of lymphocyte activation and migration are useful for treating disorders related T and B cell activation and inspration and migration in the exemplification of the immune is used in the exemplification of the immune immune is used in the exemplication of the immune im
                           invention relates to a novel method for identifying a compound that

The invention relates to a compound targeted to a nucleic acid molecule encoding the human lymphocyte specific tyrosine kinase (Lck) polypeptide. The compound is an antisense oligomucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligomucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methyloyrosine. The antisense compounds are useful for modulating the expression of the human Lck polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents a human Lck polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fused polypeptide - has amino acid sequence of beta-galactosidase with a LCK gene conjugated to the N-terminal via DNA having multi-cloning site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         galactosidase gene fused with the ick gene. It is produced by B.coli transformed with a recombinant vector (see AAQ13983). It is useful for producing an antibody specifically immunoreactive with only a lck genederived polypeptide in T cells. The antibody may recognise lck genederived polypeptides in human cells
                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence consists of the N-terminal amino acids of the beta-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (Beta-galactosidase N-terminal)-(lck gene prod.) fusion protein.
                                                                                                                                                                                                                                                                                           .,

The invention discloses isolated human nucleic acid alternative splicing variants that are all tumour-involved genes (TIGS). The nucleic acids and polypeptides are useful for determining the level of a nucleic acid or polypeptide in a biological sample, for determining the level of polypeptide sequence in a biological sample, for determining the level of variant sequence in a biological sample and for polypeptide sequences in a biological sample and for polypeptide sequence in a biological sample and for polypeptide sequence in a biological sample and for polypeptide sequence from which the variant has been varied by alternative splicing in a second the variant ample and for raising antibodies. A pharmaceutical composition comprising a carrier and the nucleic acid, is useful for treating diseases (e.g. cancer) that can be ameliorated or cured by increasing or decreasing the level of the encoded protein. The nucleic cacids are also useful for diagnostic purposes, especially for detecting cancer or a predisposition to cancer, for evaluating the state or aggressiveness of cancer disease, in basic research, for understanding the print of the priginal Tide (in targeting or health).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   developing pharmaceuticals, for distinguishing various stages in the life cycle of the same type of cells which may be helpful for the development of pharmaceuticals for various cancer stages in which cell cycle is nonnormal, for determining mutations in tumour-involved genes and in gene therapy. The polypeptides are useful for identifying compounds capable of binding to the variant product and modulating its activity and for
